

## Sprint 1 Retrospective - CampusSafe

During sprint 1 we focused more on completing the front end tasks such as login screen, home screen, and register/create account screen. We also implemented the user account database. We chose this approach since multiple team members were new to the tools we were using and we figured it would be easier to learn while doing the more straightforward front end tasks rather than jumping straight into backend.

### What Went Well:

- Everyone completed the task they were assigned
- More experienced team member was able to help us learn the tools we used
- We were fairly organized during the sprint

### What Did Not go Well:

- Since this was our first sprint as a team, and multiple members were new to the tools we were using, we were only able to complete one task each leaving a larger portion than we would have liked incomplete.
- Left our tasks towards the end of the deadline
- Poor communication about status of tasks each member was working on

### Improvements:

- For our next sprint, since we are now familiar with the procedure we will complete more tasks in order to make more substantial progress on our project.
- While we were fairly organized in sprint 1 we could have been better about things like updating the KanBan board and communication relating to the status of our individual tasks. In sprint 2 we will strive to be even more organized with more frequent kanban board updates, and more scheduled meetings in order to communicate better
