Deployment Diagram for CampusSafe

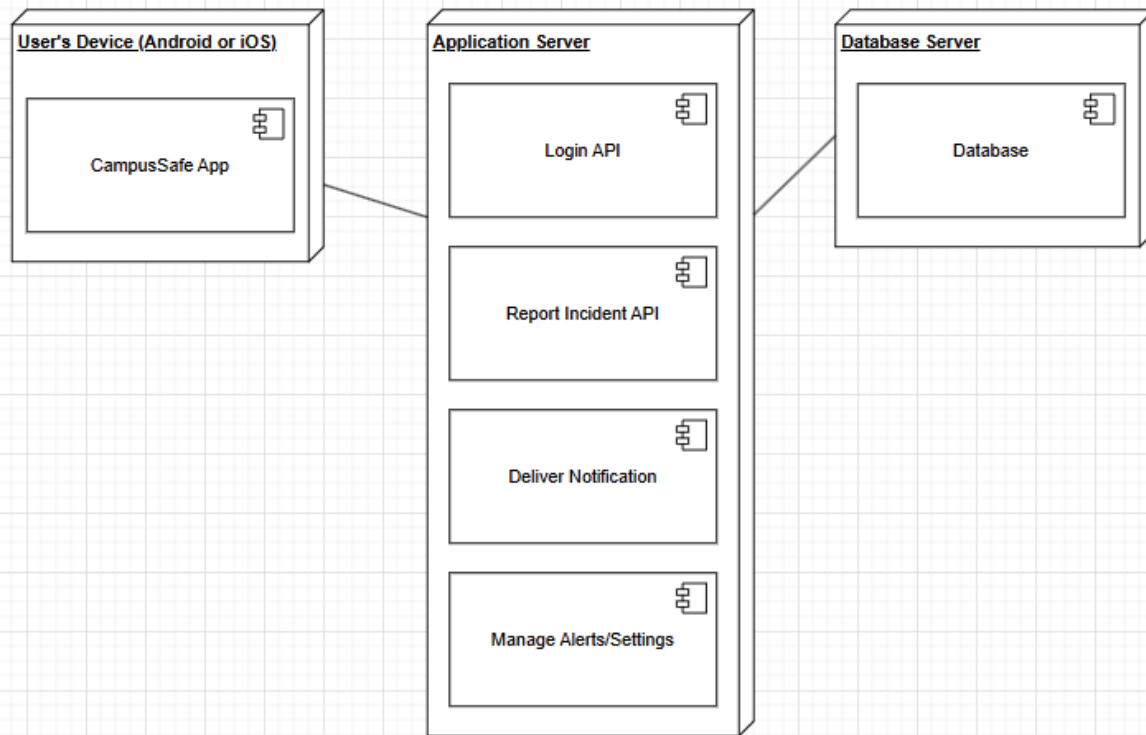

In this deployment diagram for our CampusSafe App, we have the user's device, application server, and the database server. The physical device that the application will be used on can be either apple or android. We will use a login API to verify user credentials and report incident API that will store reports that will then be used to send out notifications to users. Users will also have the option to opt in/out of notifications on the settings screen. Also, we will use a database to store login info and reports created.
